

RED BAY

* * * *

On the North End of Prince of Wales Island.

* * *

There was a gradual increase in salmon seen in the bay from July 12 to July 20, when there was a noticeable increase of salmon (Sockeyes) and as creeks were high during this run there was a splendid percentage of escapement, although the run was unusually small.

Chums appeared July 25 in the bay and they commenced going up creek July 30. There was a gradual increase in this specie and by August 13 practically 1000 chums had gone up stream. Most of these salmon made their escapement during the high tides August 13 when there was an increase of five or six inches which brought the sockeyes into the lake and the chums into the creek to spawn.

On August 16 a few more humpbacks were seen in the creek.

This bay had such unusual poor runs of salmon that it did not require protection, during the remainder of the season.

Cliff McKay,
Stream Watchman.

Season of 1924.
